

## Science and Me

The word “Science” comes from the Latin word “Scientia”, that means knowing something. It observes and understands phenomena that take place around us.

### But...What does a Scientist do?

A scientist observes and explains all types of phenomena. He compares and notes down their similarities and differences. He comes up with hypothesis. If his hypothesis are correct he writes down and records his conclusions. If they're wrong, he formulates new hypothesis and runs more experiments until he reaches a conclusion. The scientist can't do everything by himself and needs the help of other people that study Chemistry, Biology, Geology, Botany, Zoology, Meteorology, Astronomy.
